

# A Lighting Basket

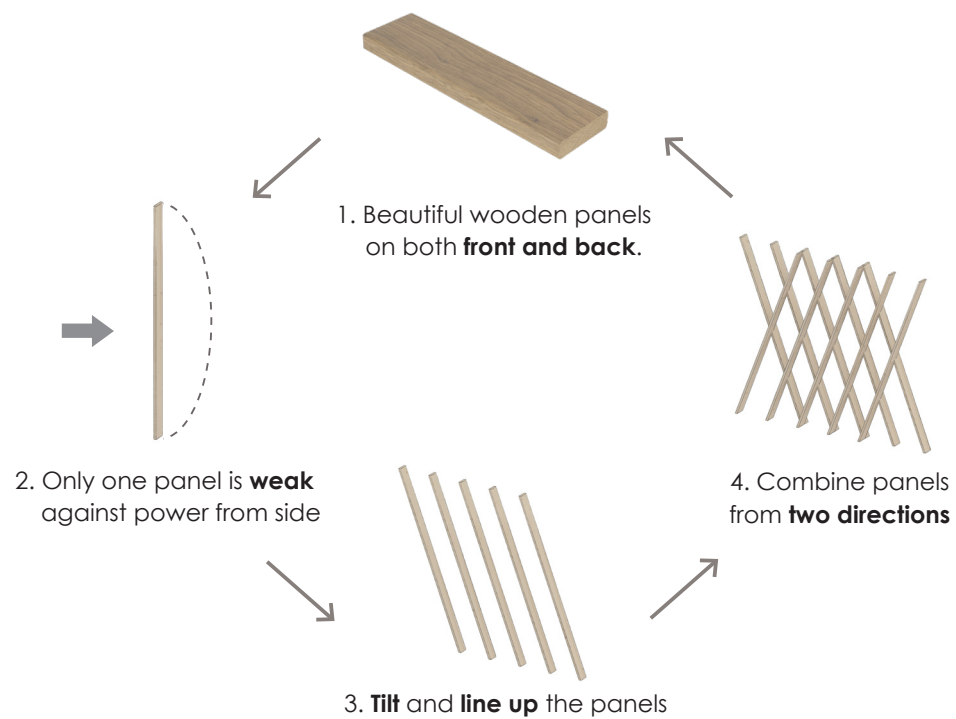

Having noticed the beauty in both sides of the sustainable platowood panels not only on the front side but also on the back side, I would like to use focusing on each individual piece of woods rather than simply sticking one side of the panels to the container.

This proposed removable panels can be installed without using nails and glue on the façade by combining small wooden panels, just like a gently woven basket. This design can be used for both exterior façade and a roof of the courtyard.

The pavilion could become a symbolic "lighting basket". A gentle atmosphere of the wooden panels and the sunlight are brought inside through the gaps between wooden panels during the day and the light from inside leaks outside in IPKW during the night.

## Concept images

"A lighting basket" gently wrapped in sustainable wooden panels.
